

Governance of Generative AI

Domestic Election Systems

Domestic Regulatory Needs

Digital Platforms from Countries of Concern

Governing Transnational GenAI Challenges

- NIST should convene industry stakeholders to **establish a standard of conduct for synthetic media**.
- Congress should **scale public digital literacy education and disinformation awareness** by passing legislation.
- Content distribution platforms should be **required to technically support a content and provenance standard**.

- An American approach to governing GenAI should act in accordance with **SCSP's Governance Principles**
- The U.S. should **continue adapting present sector-specific regulatory authorities to address issues raised by GenAI**, and Congress should legislate requirements that operationalize responsible and ethical AI principles.
- OSTP, with OMB, or another equivalent government entity, should **provide sector regulators with tools to determine which AI uses should be the focus of their regulatory efforts**.
- Congress should consider overtime **establishing a centralized AI authority** that can regulate AI issues that cut across sectors and fill regulatory gaps.

- Congress should take necessary steps to **consider narrow, product-specific restrictions on foreign digital platforms representing national security risks**, such as TikTok.
- The U.S. should **develop a more comprehensive risk-based, policy framework** to restrict foreign digital platforms from countries of concern.
